# A VICTORIAN BRASS MOUNTED WROUGHT IRON AND ELM STEELYARD BALANCE,

the brass weight sliding on the tapered arm with subtle notches of wear, with wrought suspension hooks and precisely cast brass fittings, the brass weight = 3.95kg,

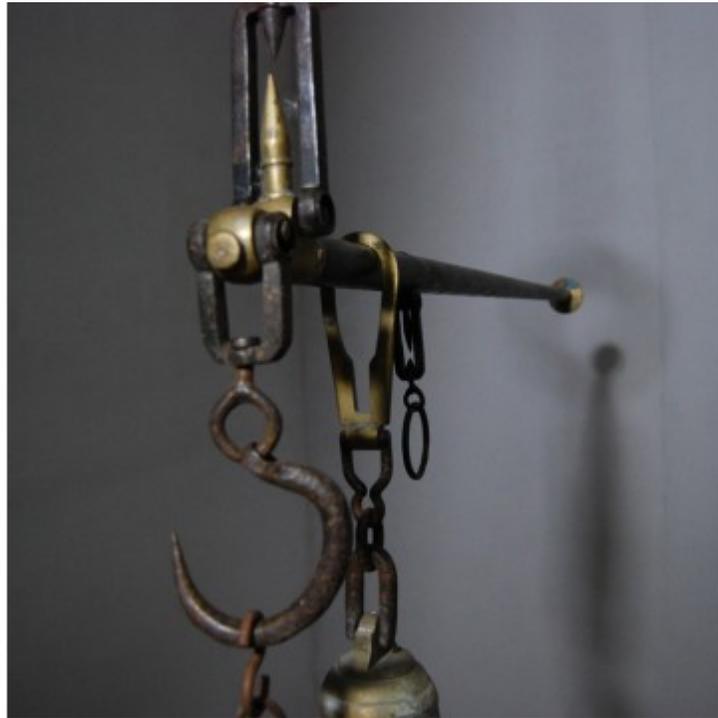

DIMENSIONS: 106cm (41<sup>3/4</sup>" ) Wide

PRICE: £160.00

STOCK CODE: 44252

LOCATION: LASSCO Three Pigeons

## HISTORY

Pictured here weighing a sack of bricks of 20kg. (Sack of bricks not included).

A steelyard balance (or steelyard, or stilyard - also known as a Roman steelyard or Roman balance) is defined as a straight-beam balance with arms of unequal length. It incorporates a counterweight which slides along the longer arm to counterbalance the load and indicate its weight. It exemplifies the law of the lever, wherein, when balanced, the weight of the object being weighed, multiplied by the length of the short balance arm to which it is attached, is equal to the weight of the

counterweight multiplied by the distance of the counterweight from the pivot.

The steelyard was in use among Greek craftsmen of the 5th and 4th centuries BC, even before Archimedes demonstrated the law of the lever. And Roman and Chinese steelyards were independently invented around 200 BC. The *Oxford English Dictionary* suggests that the name "steelyard" is derived from *steel* combined with *yard*, influenced by a "misunderstood" allusion to the Steelyard, the main trading base of the Hanseatic League in London in the 14th century.

Large steelyard balances (known as cart balances), both public and private, were a common feature in agricultural areas in England from the eighteenth century forward. An example of a public cart steelyard remains at Soham, Cambridgeshire and another is to be seen at Woodbridge, Suffolk.
